Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

(DUPO) DU PONT DE NEMOURS & CO

WPI; 2002-557827/59. P-PSDB; ABB84278.

New nucleic acid molecule encoding replication protein/plasmid stability protein, useful in cloning and expression vectors, particularly shuttle vectors for expression of heterologous genes in Rhodococcus species.

Claim 2; Page 63-64; 96pp; English.

This invention describes a novel nucleic acid encoding a replication protein or a plasmid stability protein. The product of the invention is useful for expression of nucleic acid such as genes encoding enzymes involved in the production of isoprenoid molecules, polyhydroxyalkanoic acid (PHA) synthases, carotenoid biosynthesis enzymes, nitrile

       dehydrogenase, terpene synthases, and cholesterol oxidase in an Actinomycetales bacteria. The replication protein or plasmid stability protein are useful in cloning and expression vectors and particularly in shuttle vectors for the expression of homologous and heterologous genes in Rhodococcus sp. This sequence encodes the Rhodococcus ANI2 Rep protein described in the disclosure of the invention

The product of the invention is useful for expression of nucleic acid such as gense encoding enzymes involved in the production of isopremoid molecules, polyhydroxyalkanoic acid (PHA) synthases, carotenoid biosynthesis enzymes, nitrile dehydrogenses, terphane synthases, and cholesterol oxidase in an Actinomycetales bacteria. The replication protein or plasmid stability protein are useful in cloning and expression vectors and particularly in shuttle vectors for the expression of homologous and heterologous genes in Rhodococcus sp. This sequence represents the Rhodococcus and derived plasmid pANI2 DNA described in the disclosure of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid molecule encoding replication protein/plasmid stability protein, useful in cloning and expression vectors, particularly shuttle vectors for expression of heterologous genes in Rhodococcus species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel nucleic acid encoding a replication protein or a plasmid stability protein. The product of the invention is useful for expression of nucleic acid such as genes encoding enzymes involved in the production of isoprenoid molecules, polyhydroxyalkanoic acid (PHA) synthases, carotenoid biosynthesis enzymes, nitrile hydratases, ethylene forming enzyme, pyruvate decarboxylase, alcohol dehydrogenase, terpene synthases, and cholesterol oxidase in an Actinomycetales bacteria. The replication protein or plasmid stability protein are useful in cloning and expression vectors and particularly in protein excross for the expression of homologous and heterologous genes in Rhodococcus sp. This sequence represents the plasmid pRHBRI71 DNA described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel nucleic acid encoding a replication protein or a plasmid stability protein. The product of the invention is useful for expression of nucleic acid such as genes encoding enzymes involved in the production of isoprenoid molecules, polythydroxyalkanoic acid (PHA) synthases, carotenoid biosynthesis enzymes, nitrile dehydrogenase, terpene synthases, and choleschool oxidase in an Actinomycetales bacteria. The replication protein or plasmid stability protein are useful in cloning and expression vectors and particularly in shuttle vectors for the expression of homologous and heterologous genes in Rhodococcus sp. This sequence represents the Plasmid pRHBR17 DNA described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TGCTGTGCGGGAAAAGTCGGTGCACATCGTGCAGACGAAATTTCTCAAGTTGCTCAT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        300
                                                                                                                                                                                                                                                                                                 The invention relates to production of aryl carotenoid compounds. The method involves transforming a host cell comprising a cyclic carotenoid having at least one beta-ionone ring with a gene encoding a carotene desaturase (CrtU) followed by growing the transformed host cell. Also provided is a method for regulating aryl carotenoid biosynthesis in a host cell. The method is useful in the production of aryl carotenoids pharmaceuticals, food supplements, animal feed additives, food colorants and cosmetics. The present sequence represents a E. coli-Rhodococcus shuttle plasmid pRHBR17 nucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  09

                                                                                                                                                                         used in the vector of the invention. The vector is a shuttle vector for a Bildobacterium, and contains: (a) a replicated essential region originated from a plasmid pNBD1 of Bildobacterium breve ATCC 15698; (b) a replicated essential region originated from a plasmid of B. coli; and replicated essential region originated from a plasmid of B. coli; and on antibiotic-resistant gene originated from a plasmid of B. coli and an antibiotic-resistant gene functioning by a Bifidobacterium. The shuttle vector can be used to transform various Bifidobacteria species
                                                                  contains specific elements
